

Clad-Metal Drip Edge (3×3)

FTE-1001TPO **TPO**

FTE-1001PVC **PVC**

DESCRIPTION

A pre-formed perimeter edge metal laminated with roofing membrane, used to terminate single-ply roof systems at the eave and rake. Because the metal is clad in TPO or PVC, the edge heat-welds directly to the field sheet, producing a fully watertight, monolithic termination and eliminating separate stripping-in. The 3" roof flange and 3" fascia face direct runoff clear of the wall and fascia.

FEATURES

- Membrane-clad metal — heat-welds directly to the roof for a watertight edge
- 3" roof flange × 3" fascia face profile
- Available clad in TPO or PVC to match the field membrane
- Factory-formed for straight, consistent edge lines
- Combines edge metal and stripping-in into a single detail

SPECIFICATIONS

Roof flange	3 in
Fascia face	3 in
Cladding	TPO or PVC membrane
Metal core	Galvanized
Unit	Each (standard 10' lengths)

Membrane compatibility: TPO and PVC single-ply membrane roof systems.
